Inbox Focus

Your email, in order of importance.

Reads Outlook, shows first what needs you, summarises long threads, suggests the reply and the tasks. You decide and you send.

THE PROBLEM

The inbox does not tell you what matters

1

Dozens of emails a day, mixed with notifications and newsletters.

2

Threads with 20 or 30 messages: to reply you have to read everything again.

3

A customer's urgent request sits below whatever arrived later.

4

Tasks hidden in the middle of the text, never written down.

5

Writing every reply from scratch.

HOW IT WORKS

Four steps, you always have the last word

1

Reads

Classic Outlook on this PC (or Microsoft 365 through the Graph connection). Nothing leaves the PC except the text sent to the AI.

→

2

Ranks

Each conversation gets a level, P1 to P4, from clear rules: deadline, customer, type of request, days waiting. It always says why.

→

3

Prepares

The AI summarises the whole conversation, lists the tasks and writes a suggested reply in the email's language.

→

4

You decide

You edit, create the draft in Outlook and send it yourself. The app never sends or deletes emails.

OVERVIEW

A list of what needs you, most urgent first

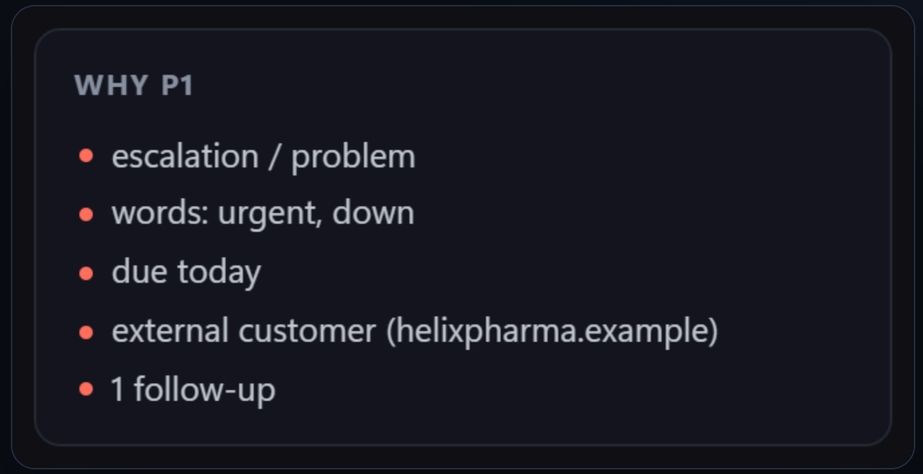

- One row per conversation, not per email: level, sender, type of request and a 2–3 sentence summary.
- Deadlines in sight (overdue, today, tomorrow) and how many business days it has been waiting.
- P1–P4 counters at the top; the tab icon shows how many P1 are left.
- Refreshes by itself every 15 minutes and shows a Windows notification when a P1 arrives.

PRIORITY

P1 to P4, always with the reason

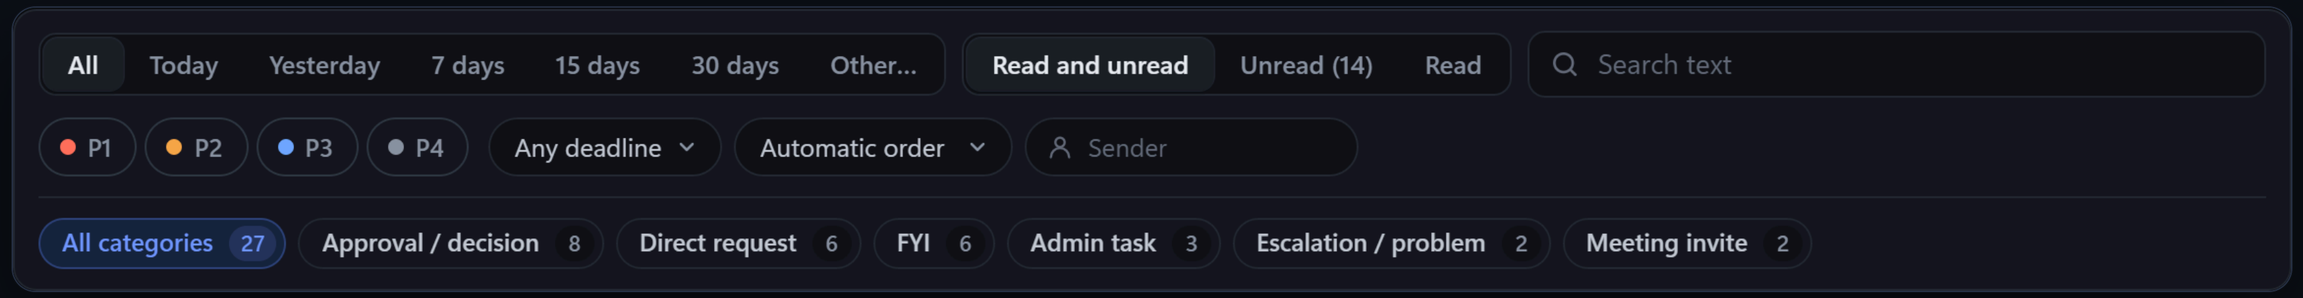

- Transparent rules: escalation or problem, urgency words, deadline, external customer, high importance, follow-ups, business days waiting.
- VIP senders and important topics (e.g. performance review, 1:1) go up one level.
- The AI may adjust one level, and says why.
- Disagree? Change the level on the row; the app learns and suggests treating the sender as VIP or noise.

FILTERS

Find quickly what matters right now

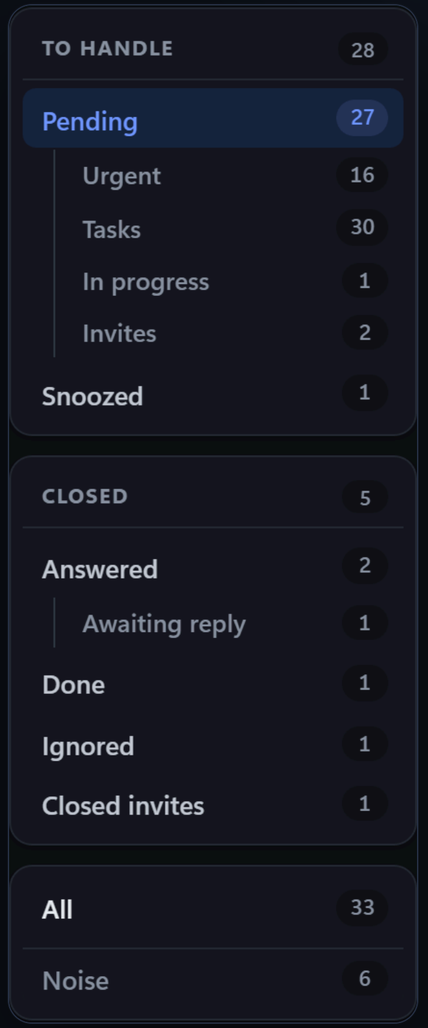

- Dates: All, Today, Yesterday, 7, 15 and 30 days, or Other… with any number of days.
- Read / Unread, P1–P4 (click one to show only that level), deadline, category, sender and text search.
- "Only older" shows the opposite: what has been idle for more than those days.
- Automatic order or your choice (priority, date, deadline, waiting time…), with a second criterion to break ties.

VIEWS

Everything in its place

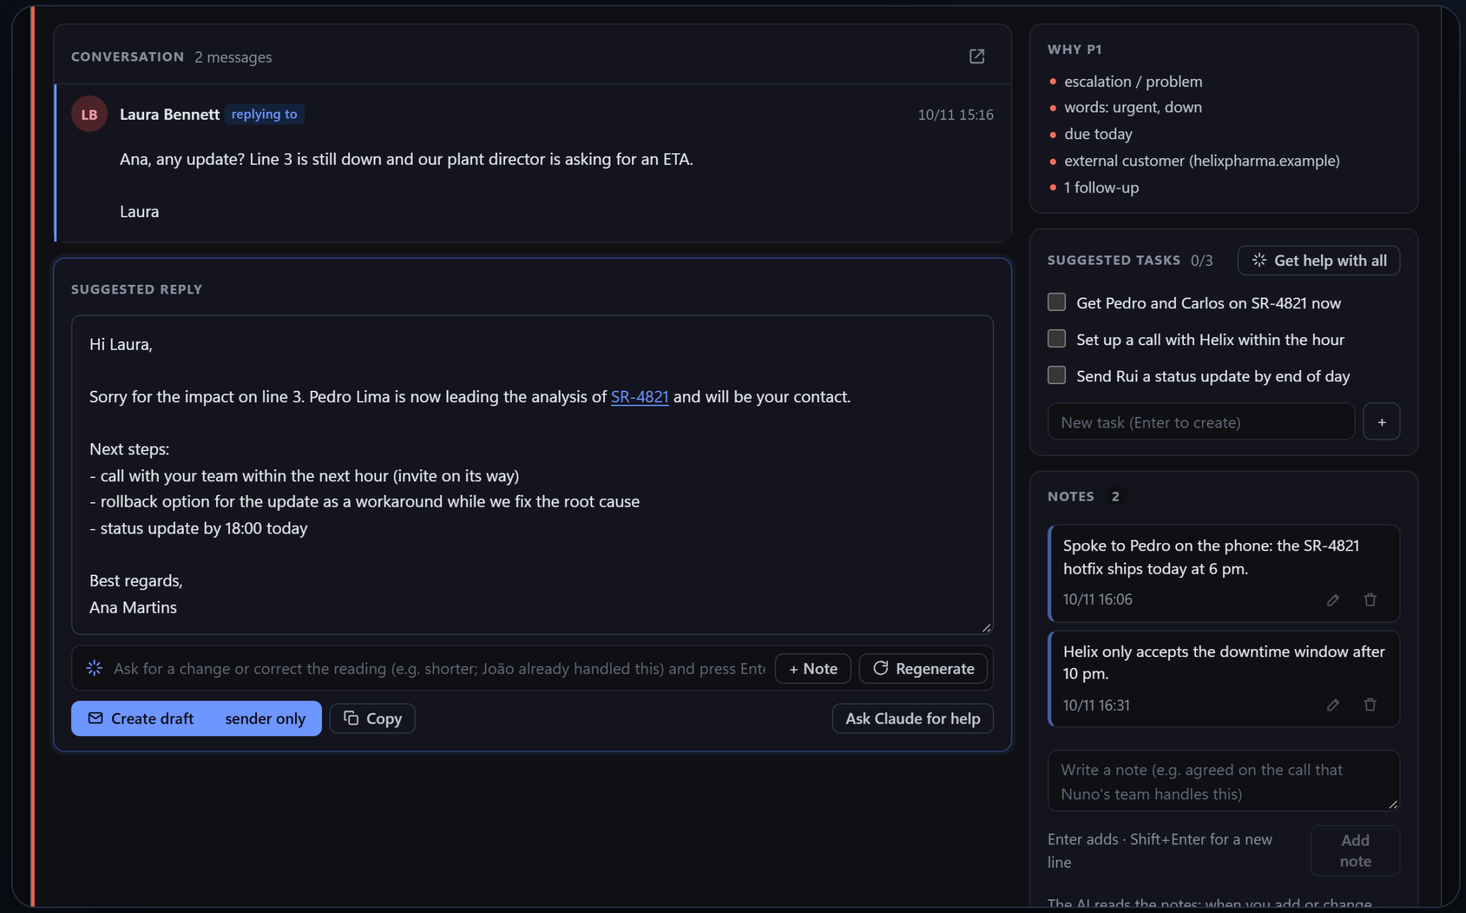

- Pending: what is waiting for you. Urgent: P1, P2 and deadlines today or overdue.
- Tasks: everything to do besides replying.
- In progress: what you already started. Awaiting reply: you asked for something and nobody answered.
- Invites, Snoozed, Answered, Done, Ignored and Noise, each on its own.

OPENING AN EMAIL

Everything you need to decide, on one screen

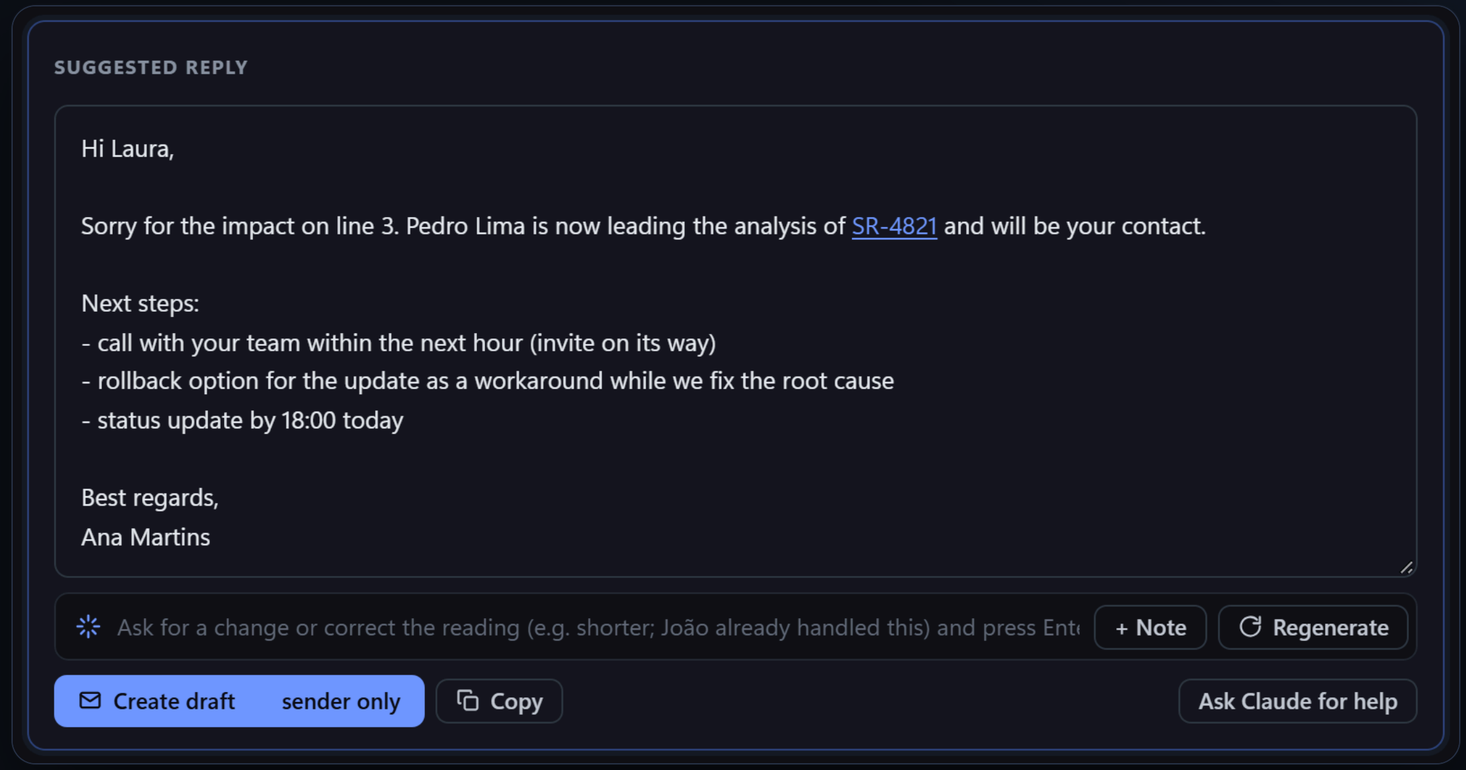

- Summary of the whole conversation: what it is about, what was said and decided by whom, and what is left.
- The Conversation with every message; the one you are replying to is expanded.
- Attachments with type, name and size; they open in the usual program. The AI reads attachment text.
- Alongside: why this level, tasks, notes and Claude's help.

SUGGESTED REPLY

A suggested reply you adjust in seconds

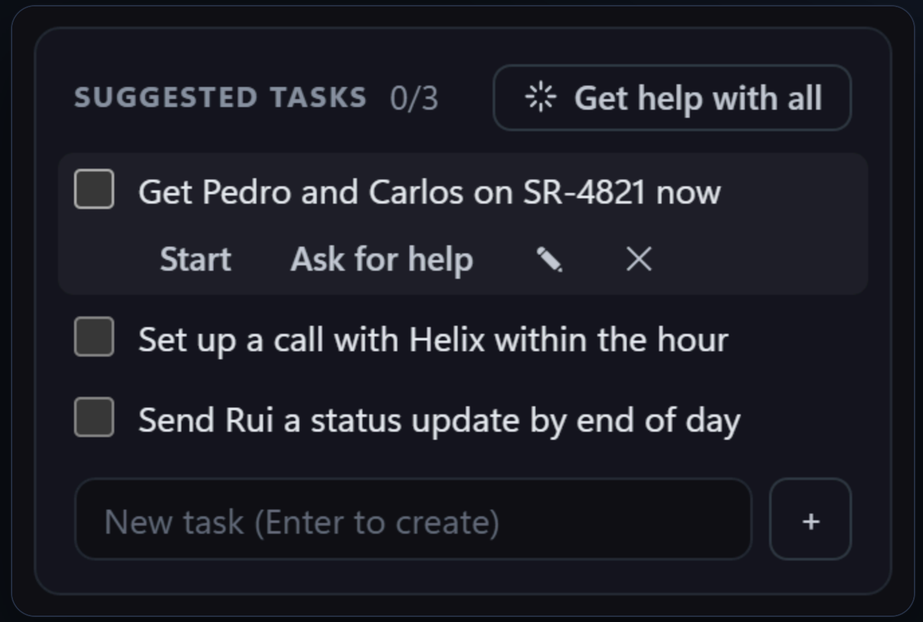

- Written in the email's language, with your signature and no stock phrases.
- Edit freely, or ask for a change: "shorter", "João already handled this".
- To change one exact spot, write a note there between `[[ ]]`: e.g. `[[say I can only do Friday]]`.
- Create draft puts the reply in Outlook (reply all or sender only). You review and send.

TASKS

What there is to do, besides replying

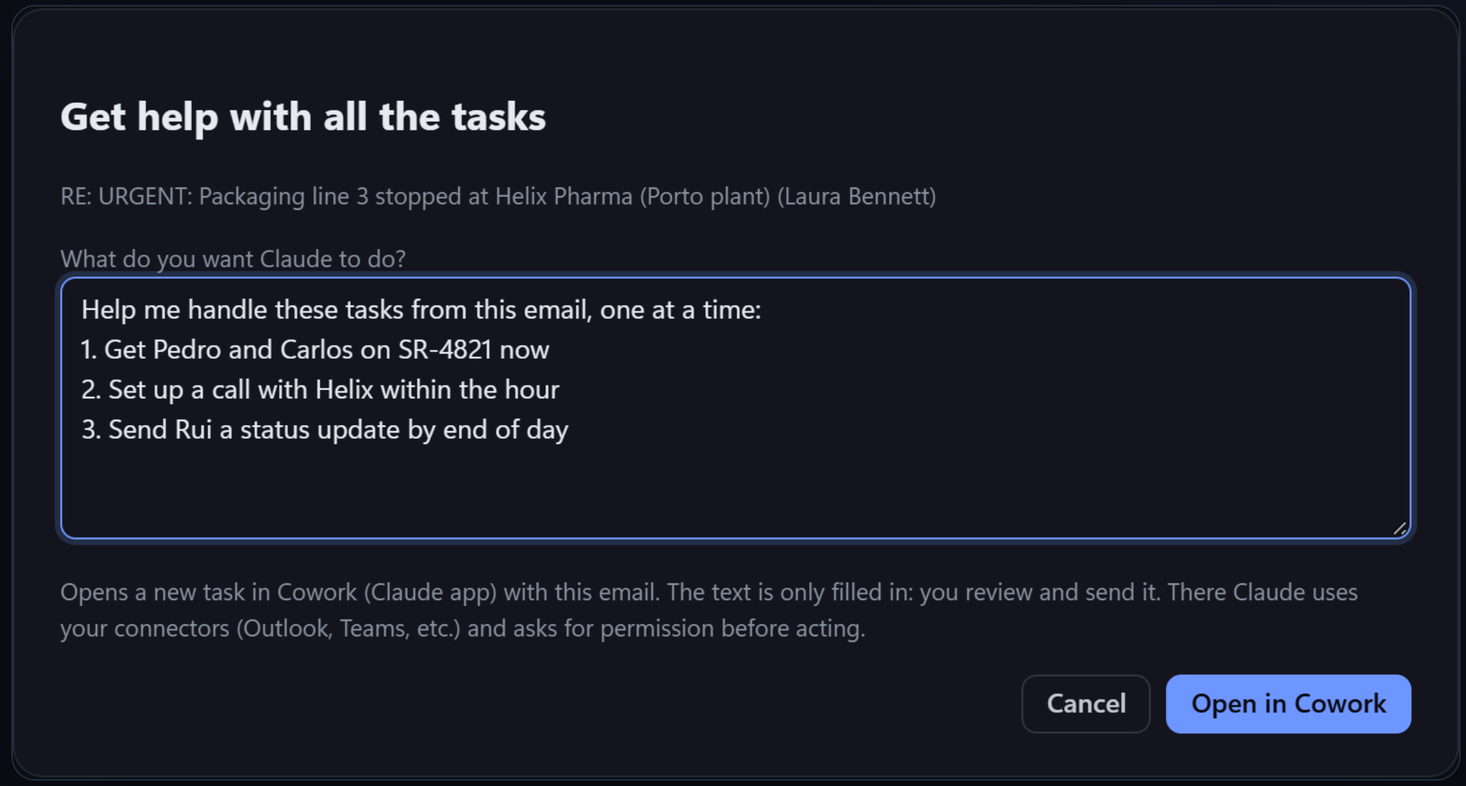

- The AI pulls the tasks out of the conversation; you add your own.
- Start (in progress) or mark as done; the reply is rewritten with your progress.
- Any task can be edited with ✎, keeping its state and its place in the list.
- A suggestion that does not fit is rejected with ✕ and does not come back.
- The Tasks view brings together the tasks of every email.

ASK CLAUDE FOR HELP

Delegate the legwork, one task or all of them

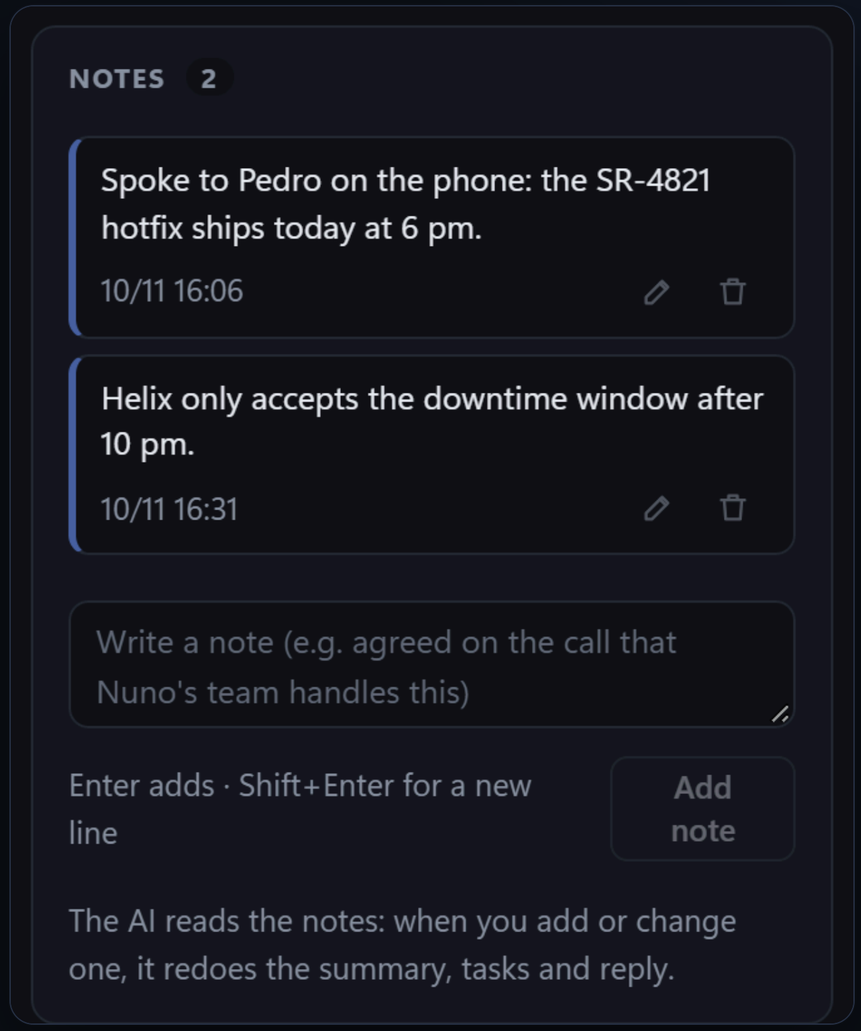

- Opens a Cowork task (Claude app) with the email and the request already filled in.
- "Get help with all" sends the tasks numbered; Claude handles one at a time.
- There, Claude uses your connections (Outlook, Teams…) and always asks before acting.
- The result comes back to the app and the suggested reply is rewritten with it.

NOTES

What only you know, the AI learns too

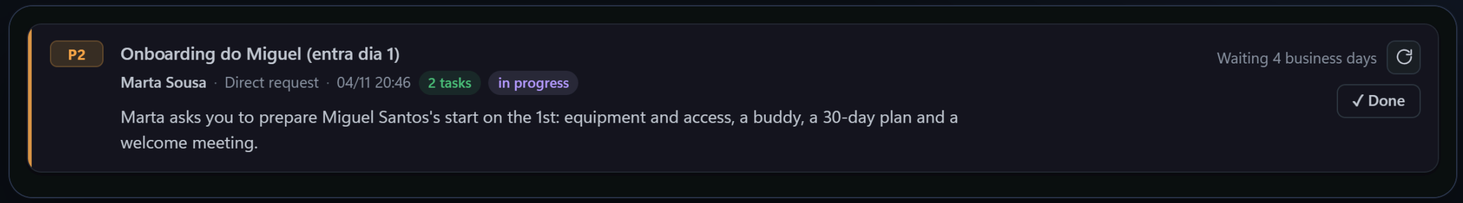

- Several notes per email, each with a date; they stay in the app, never in Outlook.
- The AI reads them all (the latest wins) and redoes the summary, tasks and reply.
- Use them to fix a wrong reading: "agreed on the call, Nuno's team handles this".
- Edit and delete with Undo; the latest one shows on the email's row.

FOLLOW-UP

Nothing gets forgotten halfway

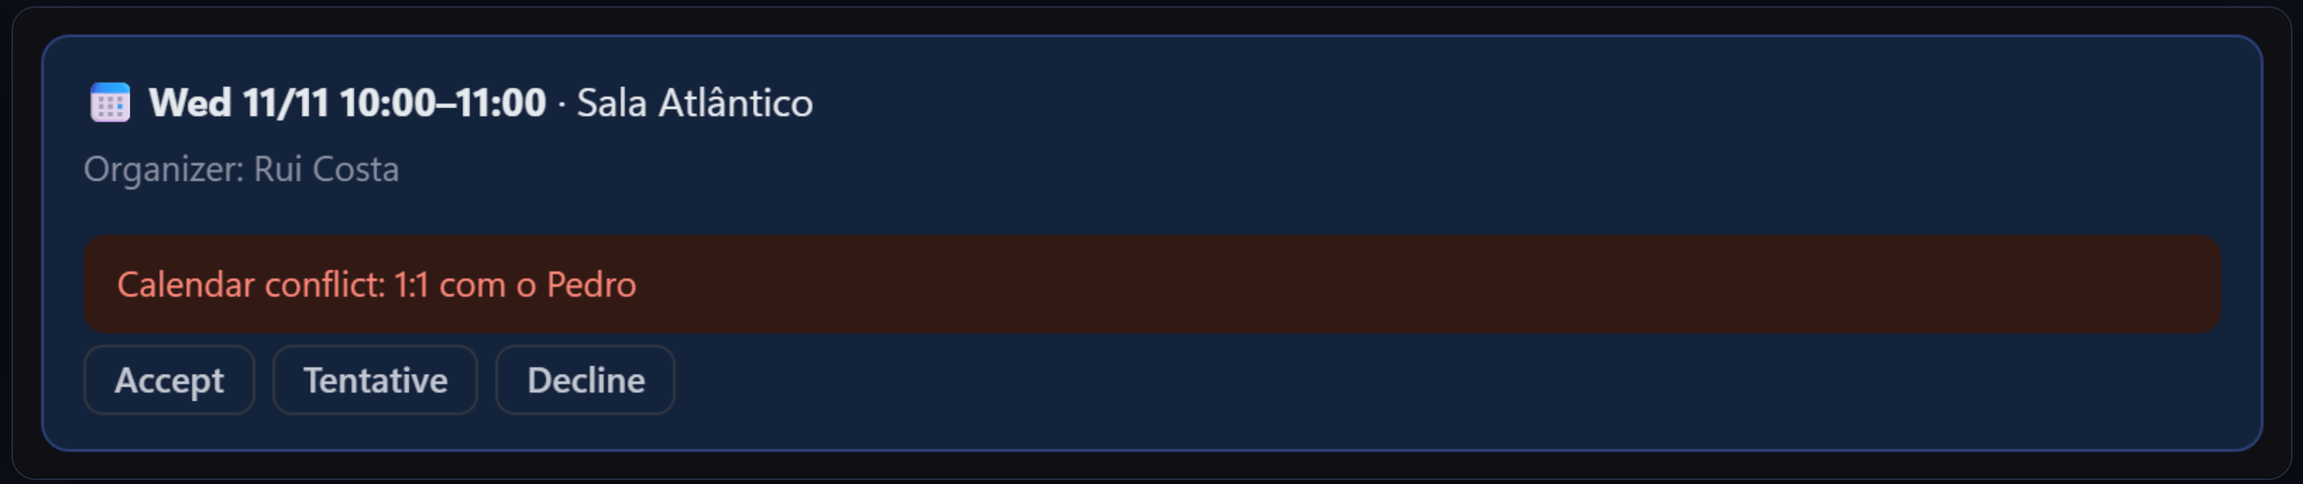

- In progress: started tasks, Claude's help requested, drafts created, or marked by hand.
- Awaiting reply: you asked for something and nobody answered; shows for how many business days.
- Create reminder prepares a follow-up draft from your last message.
- Snooze removes an email until a date; it comes back by itself, or earlier if a reply arrives.

INVITES

Meeting invites with your calendar in view

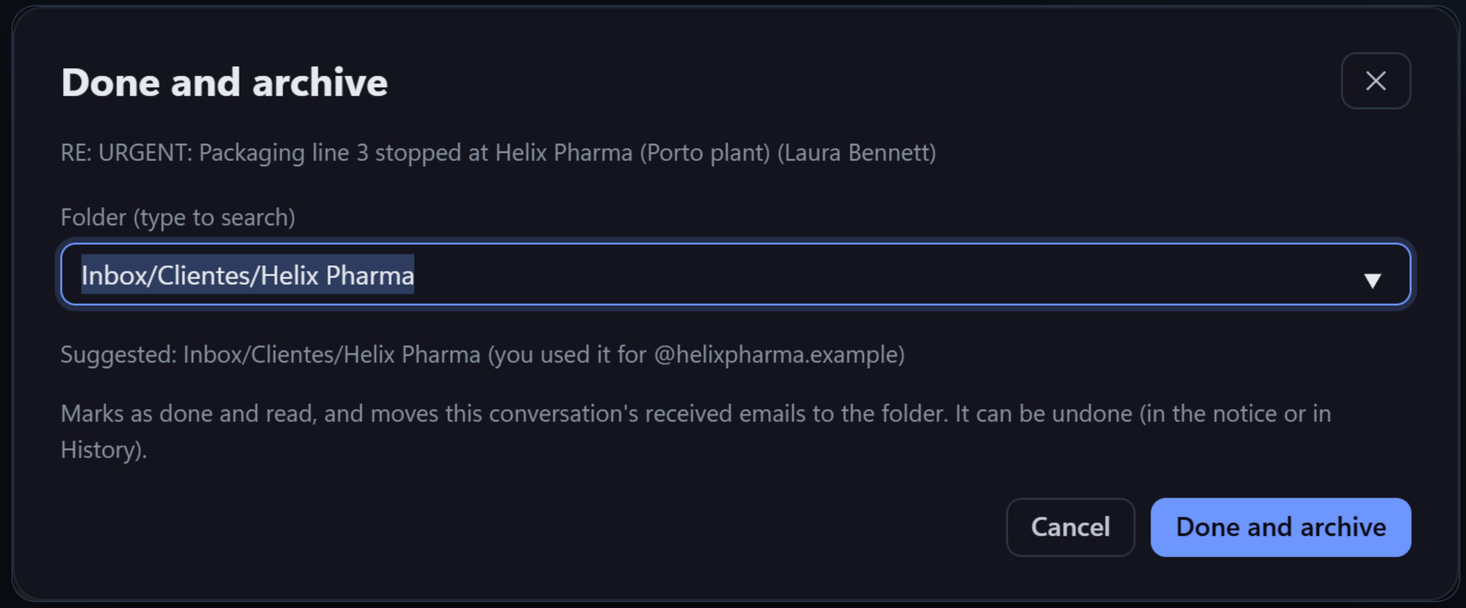

- Date, time, location and organizer, and a warning about calendar conflicts.
- Accept, Tentative or Decline open the prepared response in Outlook; you send it.
- Priority from the meeting date; a conflict raises one level.
- Tabs To answer, Answered and Past; cancellations go to Noise.

CLOSE AND TIDY UP

Clear it in one click, and the Inbox stays tidy

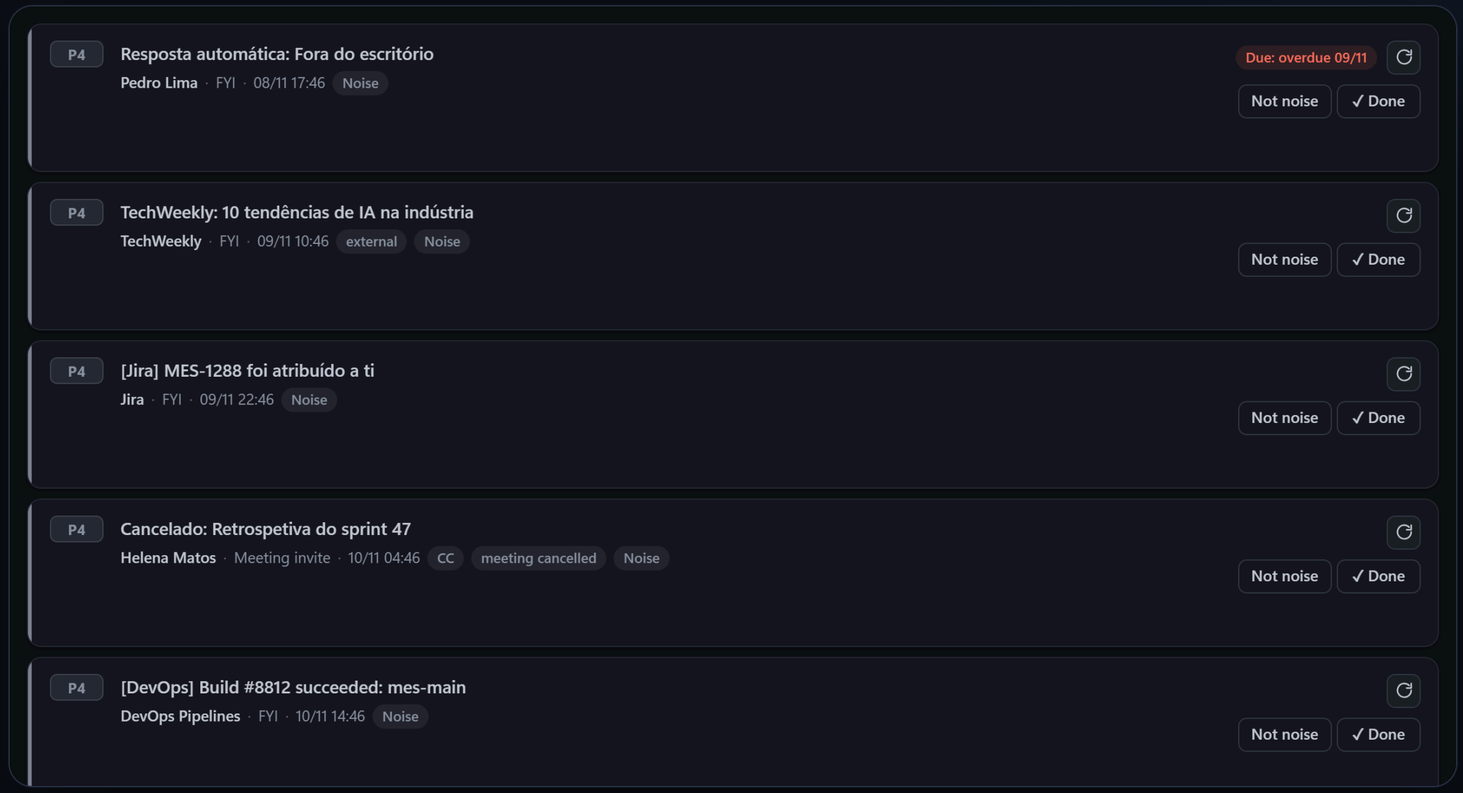

- Done closes the tasks and marks as read in Outlook.
- Done and archive moves the conversation to an Outlook folder; the app suggests the folder by sender and domain.
- Ignore removes it from the list without touching Outlook. Spam moves it to Junk.
- Everything can be Undone for 8 seconds, and later in History.

NOISE

Newsletters and notifications out of the way

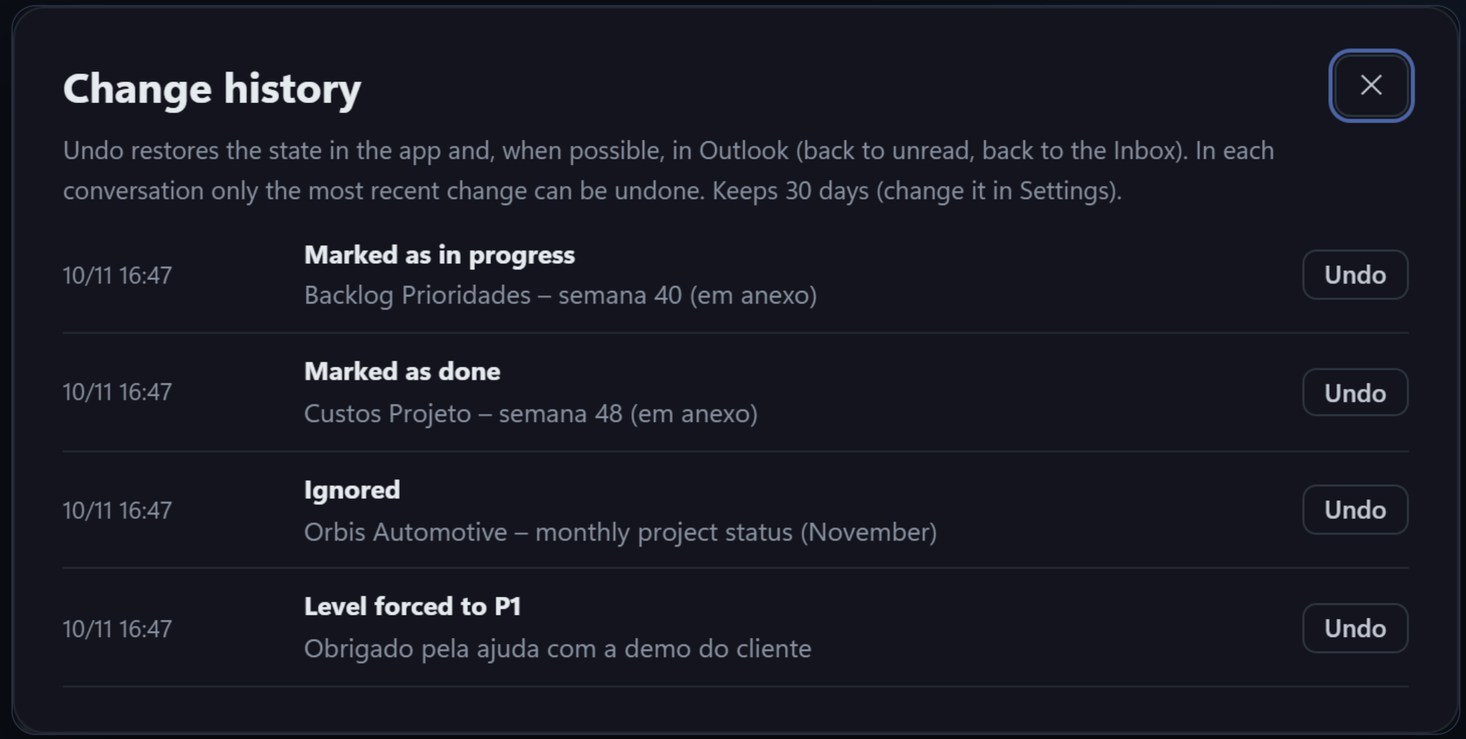

- Automatic senders, newsletters, auto-replies and emails with "unsubscribe" where you are not in To.
- Each one says why it is noise (e.g. noreply sender).
- Approval or access requests are never noise, even from a no-reply address.
- Not noise brings it back; the app learns the senders you ignore.

HISTORY

Made a mistake? Undo it, even days later

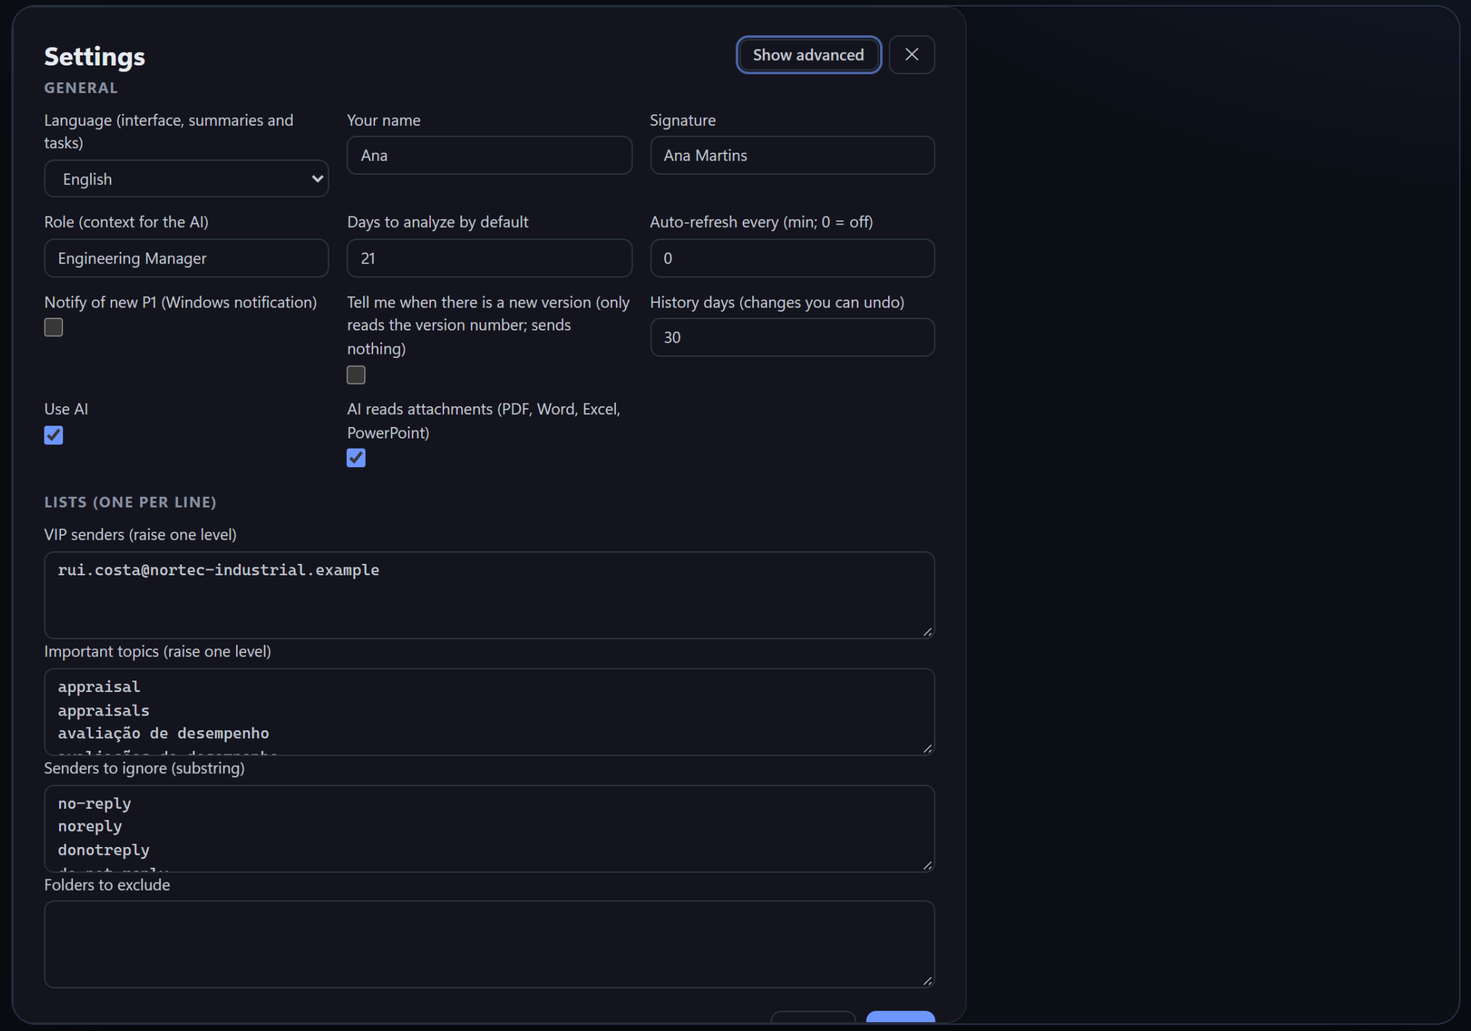

- All your changes, with Undo at any time.
- Restores the state in the app and, when possible, in Outlook: back to unread, back to the Inbox.
- In each conversation the most recent change is undone first.
- Keeps 30 days by default (change it in Settings).

SETTINGS

Tuned to you, without touching code

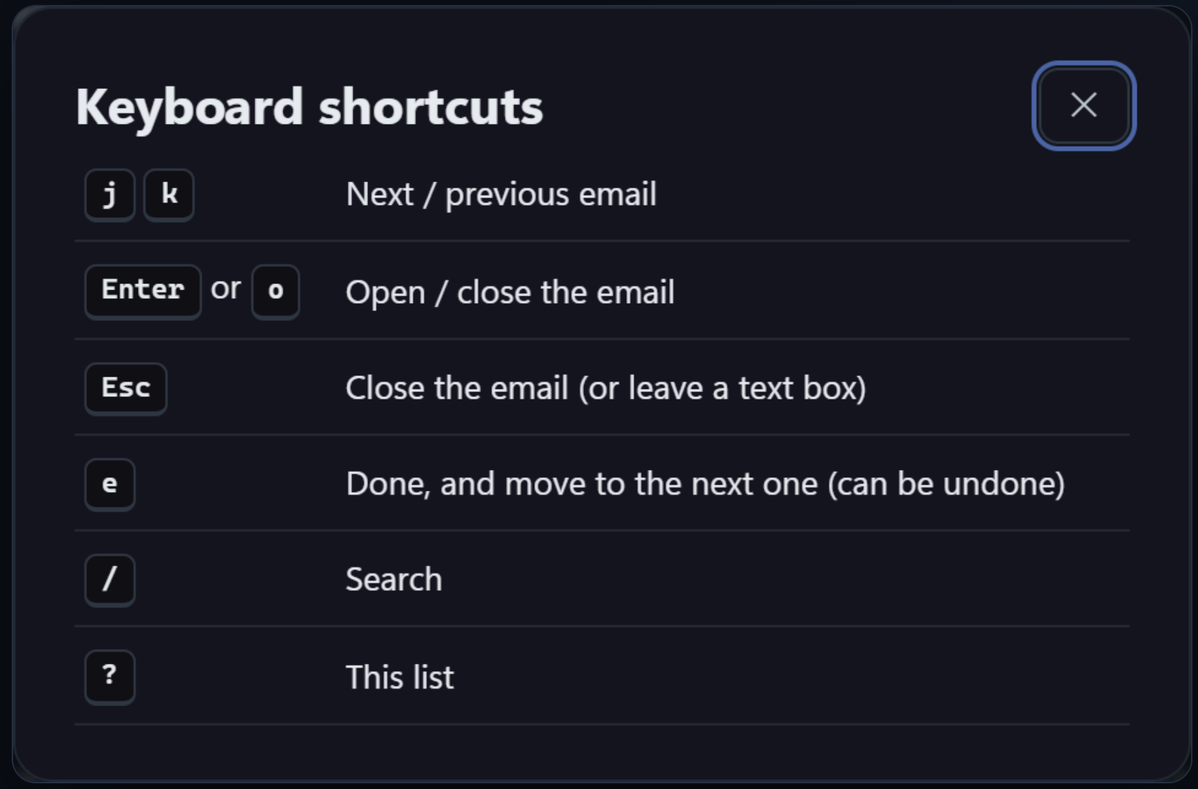

- Language (Portuguese or English): interface, summaries and tasks.
- Auto-refresh, notify of new P1, history days, new-version notice.
- VIP senders, important topics, senders to ignore, folders to exclude, urgency words.
- Automatic AI up to a level and only for recent days; the rest is generated when you open the email.

SPEED

Keyboard shortcuts and light or dark theme

- j / k to move, Enter to open, e for Done, and more (press ?).
- Follows the Windows theme: light or dark.
- Your filters, order and period are remembered.

TRUST

Built for work email

✓ Never sends

Replies stay as drafts in Outlook. You send them.

✓ Never deletes

Spam moves to Junk; everything can be undone.

✓ Stays on your PC

Data stays on the PC. Only the clean email text goes to the AI, and the AI can be turned off.

✓ Explains itself

Every level says why. The rules are in Settings, in plain sight.

✓ Asks before acting

Claude in Cowork asks for permission before sending or changing anything.

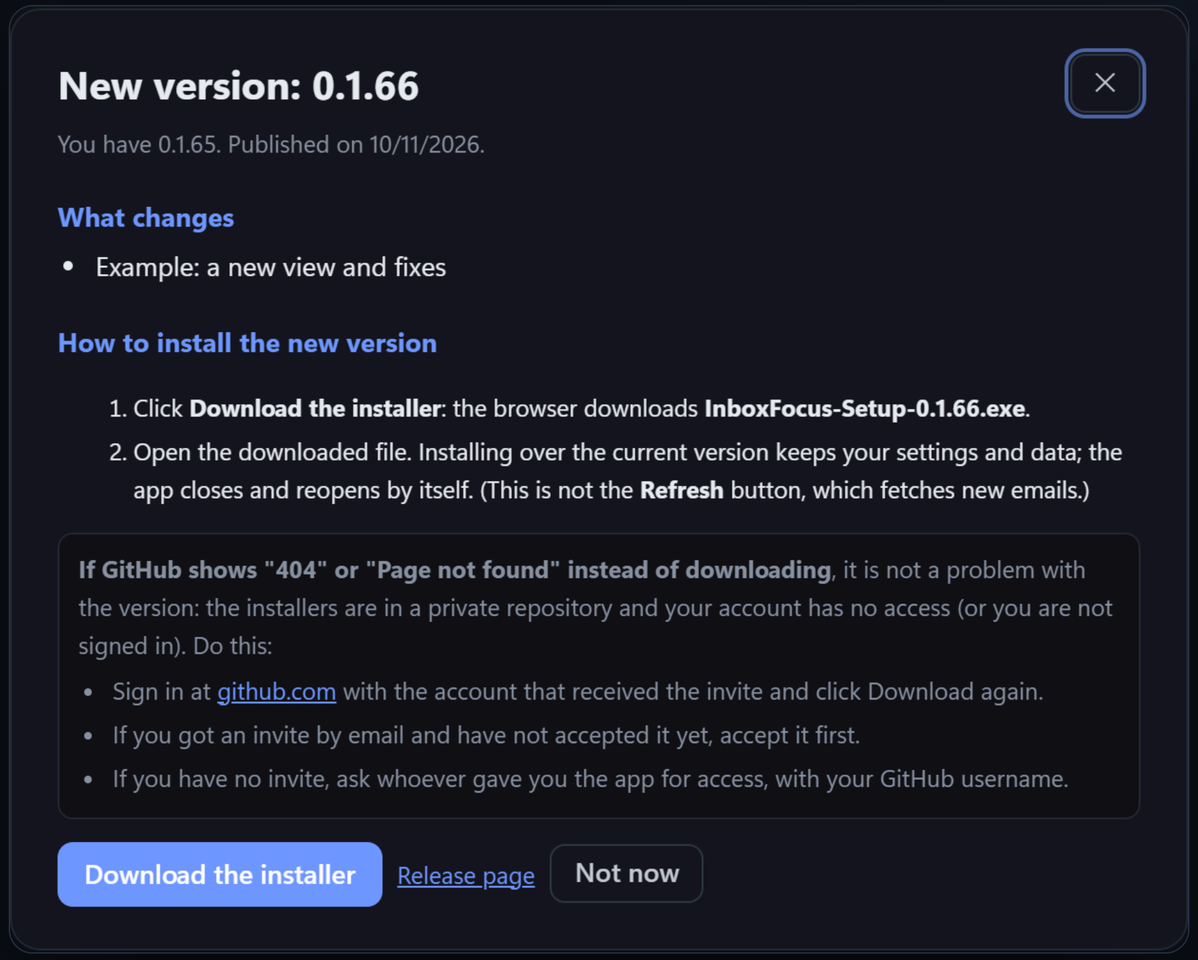

✓ No content in logs

The app's log files do not store email content.

GET STARTED

Install, try it out and keep it up to date

- Needs Windows and classic Outlook (or the Graph connection to Microsoft 365).
- For the AI: Claude Code with the company account. Without it, the app works without summaries or replies.
- Demo version: fictional data, no Outlook needed. Good to try it out or show it.
- The app tells you when a new version is out, shows what changes and downloads the installer.

Less time in the inbox.
More time on what matters.
